

Extra info regarding the assignment:

From teacher:

Hi All,

The Assignment 2 brief, including the case study and task requirements, is now available from Moodle in the Assessments block.

Please carefully read the entire brief.

As part of your responsibilities for this task, remember to keep up to date with *all* Ed Assignment 2 forum postings. This forum must be used only to seek clarification on **the task requirements**.

Assignment 2 is due on **Monday, 8th June at 11:55 PM**.

The task is an **individual assignment task**; the work you submit must be *your own work* and **must be supported by a clear development history on GitLab (a minimum of 2 pushes per file)**. Please take particular care to ensure that when you push files to GitLab, your author details are correct (this must be checked regularly).

Generative AI tools can be used for Task 2 to assist you with the generation and insertion of your test data. You must clearly acknowledge the source, following Monash Guidelines (see the brief).

All tasks must be completed from within Visual Studio Code using the SQL Developer Extension.

Your mark for the assignment will be scaled to a maximum of 30, with up to 5 marks added based on your completed Applied assessment tasks (AT8, AT9, AT10, AT11 and AT12).

FIT2094 Teaching Team

Hi All,

The licensing for GitLab Duo under the GitLab server has recently changed from being bundled into the server as, now, an extra cost. Since the University already supports an approved AI, a licence for GitLab Duo will not be procured. This means that GitLab Duo is no longer available.

For developing insert statements (for example, for Task 2 of Assignment 2) and general Monash AI, you *should* make use of the Monash instance of Google Gemini. Monash Gemini has several significant advantages, explained [here](#) under "Benefits of Gemini Education Plus". The large context window is particularly helpful. To use Monash Google Gemini, you must "Opt in" - see the link above. Gemini has mobile apps for Android and iOS, a desktop app for macOS and the browser-based Gemini web at <https://gemini.google.com/> - just login with your Monash login details.

To use Gemini to create insert statements, add your schema as a file (click on the +) and provide your prompt. Given the large context window, you can then easily continue to refine the output as required in one ongoing session. If u want and think that u want to use other ai tools u can

Assignment 2 FAQ

Questions regarding the assignment and response from Teacher

Student: Hi,

Can any statements in "Oracle SQL Functions" (Applied 11) be used?

Teacher: Yes

Student: Hi,

For Task 1, should we only add non-PK constraints that are explicitly shown in the data model, or should we also add simple constraints that are implied by the written business requirements?

For example, the business description says that a quote may be accepted and then assigned to a job, while unaccepted quotes remain unfulfilled. This seems to imply that one quote should become at most one job. Should we therefore add a constraint on job.quote_no to prevent the same quote from being used for multiple jobs?

Thanks!

Teacher: Hi Zimu,

If the constraint supports the business rule and we have discussed it in our unit, you should add it to Task 1.

If the constraint is very complex, for example, comparing 2 columns, or needs to include a condition (e.g. if bla then bla) and has never been discussed in the unit, then you do not need to add it.

Dwi

Student: Hi team,

I was wondering do we get marked on the documentation of the code.

Thanks!

Teacher: i believe so, based on this part of the assignment instruction (i assume this is what you mean by documenting your code, like commenting it)

9. You are **required to include clear, *concise*, and informative comments throughout your SQL/MongoDB code**. Comments should describe the purpose, logic, and key steps of your approach. Insufficient or missing comments will result in a loss of marks (see the marking guide at the end of this document).

Student: In the EMPLOYEE table, the attribute `emp_licenceno` is described as "Employee licence number (only for drivers)".

Could you please clarify whether we should:

1. Allow `emp_licenceno` to be NULL for non-driver roles, and store values only for drivers, or
2. Enforce a constraint so that only employees with role 'D' must have a licence number (and others must not)?

I'm not sure whether any CHECK constraint is expected for this relationship, or if simply allowing NULL is sufficient.

Thank you!

Teacher: Hi Yanfei,

Enforce a constraint so that only employees with role 'D' must have a licence number (and others must not)?

Have you learned to write such a constraint in this unit? If you haven't, then you do not need to write such a constraint. That said, you still need to enter the correct data in accordance with the business rules.

Dwi

Student: for T6 a , the er diagram shows that both `cust_gname` and `cust_fname` can be null. the task only says to display the customer full name but does not specify what to display when both are null. what should we display in this case?

Teacher: Hi Jon,

Each person must have a name; it could be a first name only, a last name only, or both first and last names.

Dwi

Student: i have two questions about A2 T6:

1. in the sql database, `job_cost` is stored as null when the actual job cost is the same as the quote cost. the assignment does not clearly explain what `total_paid_jobcost` and `total_unpaid_jobcost` should include. does it mean the sum of `job_cost` directly, or should we use `quote_cost` as a fallback when `job_cost` is null to get the correct total?

2. in mongodb, when filtering with multiple conditions on different fields, is it acceptable to put all conditions inside a single {} like this {condition1, condition2} or we need to use \$and?

Teacher: Hi Jon,

1. If the job cost is null (since it is the same as the quote cost), you need to use the quote cost as the job cost. Then, sum them up.
2. It is preferable to specify the logical operator, i.e. use \$and

Dw

Student: Hi, I would like to clarify the required time format for the assignment.

In Task 2 and Task 3, when inserting or handling DATE values (e.g. pickup time such as "9 AM on 25 May 2026"), is there a required standard for time representation?

Specifically:

- Are we expected to use 24-hour format (hh24:mi), or
- Is 12-hour format with AM/PM also acceptable?

I noticed that most examples use hh24 format, but the question wording includes "AM", so I just want to confirm the expected convention to avoid losing marks.

Thank you.

Teacher: Hi Yanfei,

You may pick any date format in Task 2 and Task 3.

Dwi

Student: Hi,

Quick question: I noticed the brief says that calculations cannot be done manually and must be completed in Oracle.

If I have a given date/time value, what is the correct Oracle SQL syntax for adding a specified number of hours to it? For example, how should I write "X date/time plus Y hours"?

Thanks.

Edit - or is it okay if we just manually insert the date.

Teacher: Hi Ashwin,

If the date and time are provided, you can use them. However, if they are not given in the question, you need to do the calculation based on the information given in the question.

Dwi

Student: Hi teaching team. For our sample data, does my truck vin need to conform to any standards? or is it okay as long as it follows the 17 character constraint.

Teacher: Hi Zi,

Your data must be sensible. It does not have to be perfectly correct (a real VIN), but it has to be sensible. We allow you to use GenAI Tool for Task 2 so it can help you generate sensible (but fake) data.

Dwi

Student: Hi - just a quick question. When generating the JSON data using sql, do we want to include all customers (and display the quotes as null if they haven't made any) or do we only display customers that have been quotes? thanks

Teacher: Hi Ashwin,

Only customers who have at least one quote.

Dwi

Student: Hi, may I ask for T3 only capital T represent Truck Dispatcher, no possible that t represent Truck Dispatcher? Thank you so much.

Teacher: Hi Wenxi,

When handling strings, you must account for potential data inconsistencies in the database. Please revisit Workshop 7 and Applied 8 about comparing strings in DMLs.

Dwi

Student: Hi, for the a2 T1, is there are any restrict on emp_role and emp_licenceno, for example, do we need to check if they have licence when they are drivers? Thank you:)

Teacher: Hi Wenxi,

This is something that we assess you on. So, you need to read the brief carefully and make a decision.

Additional note: Do not add any check constraints that are not taught in the unit.

You need to check all of the business rules when generating your test data (in Task 2), but again, do not add complex check constraints that are not covered in the unit.

Dwi

Student: Hi teaching team,

May I ask how detailed/informative should the comments in the assignments look like? Is there a certain format e.g. just a concise one line comment for a complex block of code in sql/mongodb files?

For example in task 5 for sql select, do I explain for example why I uses outer join / case in my statements. And in schema file do i explain each constraint that I added?

Thank you!

Teacher: Hi Leroy,

Use a short one or two-sentence comment for each block of code (e.g. for create, constraint, select, update, etc).

do I explain for example why I uses outer join/case in my statements --> yes, but keep it short

Dwi
